

Streamlining the handover

JAC's medicines management solution allows the effective exchange of information between acute and community healthcare providers.

Patient discharge with JAC

Following an inpatient episode of care, a lack of clinical information and inconsistent provision of the information to GPs can introduce clinical risk and lead to a discontinuity in patient care.

Today, JAC offers acute Trusts with a proven solution for ensuring fast, and reliable communication between acute and community care systems using electronic interfacing with GP systems.

The JAC solution produces a comprehensive discharge summary for a patient's GP via the Discharge Prescribing module – a solution that already meets the April 1st 2010 targets.

In addition to the medicines prescribed on discharge, the letter contains detailed information about what medicines the patient was admitted on, which medicines on admission were modified or stopped and the reasons for change.

The discharge summary is populated with patient demographic information drawn directly from patient record. Additional information can be included about known allergies and under twelve other configurable clinical notes headings.

All the information can be printed out as a clear and legible letter and output electronically via the outbound GP Interface.
